# Duration and Asset/Liability Management (ALM): Practical Approach, Theory and Case Study.

California Debt and Investment Advisory Commission  
Public Funds Investment: Strategy in Practice  
January 25, 2023 – Montebello, CA

# Strategy Development Steps for Public Investors

# “Don’t Beat the Market, Be the Market”

**Harvard Endowment:** Had 230 employees until 2017, Top 6 executives took home over \$40MM in compensation.

*Lost to S&P index by over 100bp over last 20 years and almost 500Bp over past 10 years.*

*Lost to the S&P annually for the last 12 years straight.*

## 5 Takeaway’s:

- Performance Persistence is Rare:
  - Harvard’s few moments of glory have been dwarfed by it’s failures.
- Overconfidence is an obstacle:
  - Those who have seen success get complacent and assume they are smarter than they really are.
- Reversion to the mean is powerful:
  - Sector outperformance comes and goes and is hard to predict.
- Many years of skill required to beat luck:
  - Statistically speaking, you would need many decades to understand if manager is superior.
- Indexes are hard to beat:
  - Harvard would have even lost out to a blended portfolio of 60% stocks, 40% US Bonds over last 20 years.

## The best and brightest

Annualized total return through June 30, 2020

## Can't Beat the Market, So Now What?

- Public entities generally exhibit predictive cash flows in both magnitude and timing.
- This allows public funds to create duration optimized (interest rate risk centric) allocations.
- Allocations should reflect the legal guidance of the investment policy and the desired weights of allowable sectors based on risk/reward and ALM preferences.
- Portfolio construction: Safety (IR Risk, credit), liquidity, diversified, legal, market rate of return.

# Duration, Duration, Duration!

***Being invested is more important than the allocation decision!***

Moving from Cash to two duration in Treasuries:

***Pickup approx. 40Bp Avg Yield***

Moving from two duration in Treasuries to two duration in Agency Bullets

***Pickup approx. 9Bp Avg Yield***

Moving from two duration in Agency Bullets to maturity matched Agency Callables:

***Pickup approx. 5Bp in Avg Yield***

# Anatomy of Duration

## MACAULAY DURATION

Economist Frederick Macaulay proposed simple formula (1938) to measure the **time** required to recover the initial cost of the bond (present value).

Weights are given to the present value of each cash flow (coupon payment) at the applicable interest rate for the life of the bond (YTM) then divided by the market price.

$[PV(CF1)*p1+PV(CF2)*p2...PV(CFn)*Pn] / \text{Market Price of Bond}$

Thus, Macaulay Duration states the time period within which the present value of the bond will be realized.

*e.g. Current 5 Year Treasury has duration of 4.805.*

The duration of a bond will always be less than its maturity period.

## MODIFIED DURATION

Macaulay Duration was a good tool when it was conceived to compare bonds on a relative basis as to when an investor could expect to receive the cost of their investment back. The shorter the Macaulay Duration, the “less risk” was perceived by the investor since the PV of the bond would be received sooner.

However, Macaulay Duration’s shortfall was it’s inability to measure risk associated with holding the bond during its existence. Macaulay Duration lacks the ability to measure changes in value as interest rates fluctuate.

To correct for this, the simple division of the Macaulay Duration by  $(1+YTM)$  will convert the Mac Duration from a **time** based receipt of cash flows to the **approximate change** in price given a 100bp move in rates.

## EFFECTIVE DURATION

Same as Modified Duration but accounts for prepayment risk in callables and amortizing product. Requires additional sophistication (OAS Model) to obtain.

Effective Duration **SHOULD ALWAYS** be used when a portfolio invests in callable or MBS type securities.

## Why Do We Care?

- We know modified duration measures the approximate change in value for a 100bp change in interest rates.
- Because Modified Duration has Macaulay Duration as an input, we know that TVM (time value of money) principles apply.
- Thus, we can show that in normal markets over long periods of time, the more duration we take on (risk), the more return we can achieve.
- Since earning a Market Rate of Return is a core objective (albeit a lower priority one), maximizing duration given safety and liquidity are taken care of is important. It will be the **core** determinant of how much income/return can be derived from the portfolio.
- Sector and structure profile is of secondary importance to duration.

# Approaches for Determining Portfolio Duration

## Market Based – Curve(s)

- Manager uses a single or set of interest rate curves and measures risk/reward profile to establish duration.
- Example: A Treasury curve is used to remove credit risk and determine optimal spot on the curve over some period of time.
- Manager could also use a set of curves and based on sector and structure preference could weight each curve accordingly to get blended duration.

# Approaches for Determining Portfolio Duration

## Market Based Approach Single or Multiple Curve Analysis

## Approaches for Determining Portfolio Duration

### Market Based Approach

#### Single or Multiple Curve Analysis

- Uses simple methodology by utilizing a single or multiple curves that are easily accessible.
- Risk/Reward is measured through principles like the Sharpe Ratio or a duration modified Sharpe Ratio and are relatively simple calculations.
- Does not capture true portfolio exposure (single curve used to measure duration, but portfolio is allocated across different sectors).
- Multiple curve approach requires sector allocation desires before duration established (chicken vs. egg).
- Mean-Variance Analysis possible, but requires sophistication and still optimizes market-based volatility to expected returns.
- **Does not** account for liabilities or cash flow needs of portfolio.

# Approaches for Determining Portfolio Duration

## Market Based – Index Sets

- Manager uses a set of indices and measures risk/reward profiles accordingly (ICE/BAML, Lehman/Bloomberg, etc..).
- Like multiple curves, the manager could weight their preference of sectors and structures and determine the optimal blended duration for the portfolio.

# Approaches for Determining Portfolio Duration

Market Based Approach

\*Other includes Cash, Commercial Paper, Foreign Corporate, Municipal Bonds and Negotiable CD.

### Market Based Approach Single or Multiple Index Analysis

- Again uses simple methodology by utilizing a single or multiple indices that are easily accessible.
- Risk/Reward is measured through principles like the Sharpe Ratio or a duration modified Sharpe Ratio and are relatively simple calculations.
- Single Indices like the ICE BofAML 1-5 Tsy / Agy can be heavily weighted in one sector.
- Does not capture liquidity needs or actual allocation exposure of your portfolio (unless several indices are used with actual exposure weights).
- Multiple index approach requires sector allocation desires before duration established (chicken vs. egg)
- **Does** not account for liabilities or cash flow needs of portfolio.

# Approaches for Determining Portfolio Duration

## Cash Flow Based - ALM

- Utilizes cash flow analysis to measure the timing and magnitude of liabilities.
- Uses immunization techniques utilized in the insurance and pension world to measure individual liability streams.
- These liability streams are combined and weighted to derive a total portfolio duration that will suffice to match the liability needs.

# Approaches for Determining Portfolio Duration

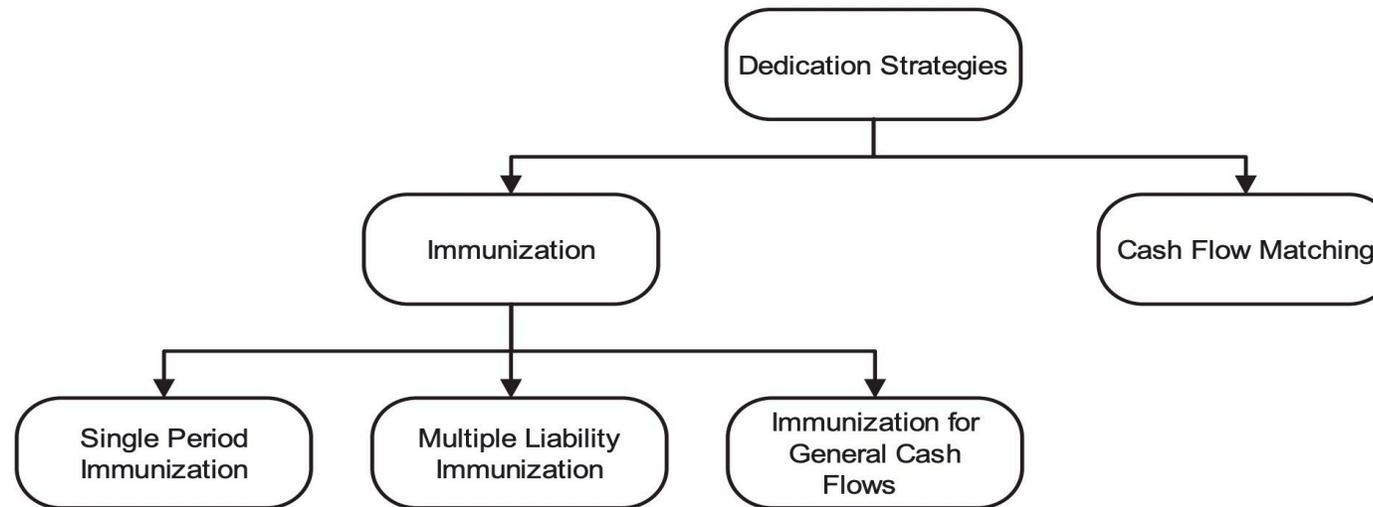

## Cash Flow Based Approach

### ALM Analysis

**Dedication Strategy**: Specialized fixed-income strategy designed to accommodate specific funding needs of the investor. They generally are classified as passive in nature, although it is possible to add some active management elements to them.

**Exhibit 6**

**Dedication Strategies**

### Cash Flow Based Approach

#### ALM Analysis

**Immunization**: Aims to construct a portfolio that, over a specified horizon, will earn a predetermined return regardless of interest rate changes (duration focused). An increase in rates and the corresponding drop in investment value partially offset by an increase in re-investment rates (and vice-versa).

**Cash Flow Matching**: Provides the future funding of a liability stream from the coupon and matured principal payments of the portfolio (not duration focused). A simple accumulation of the coupon, reinvestment return and value at horizon will offset liability in full.

***Neither strategy perfectly fits public treasury as public entities must focus on Duration as a primary risk metric and typically spend coupons as anticipated by their budget.***

## Approaches for Determining Portfolio Duration

### Cash Flow Based Approach

#### ALM Analysis

**Combination Matching (also called horizon matching)**: Popular variation of multiple immunization and cash flow matching to fund liabilities by combining the two strategies. A portfolio is created that is duration-matched with the added constraint that it be cash flow-matched in the first few years, usually the first five years.

***Since most public entities are policy constrained to five years and in, we can combine the strategies for the entire legal timeframe of the portfolio.***

# Approaches for Determining Portfolio Duration

## Cash Flow Based Approach

### ALM Analysis

#### Step 1 – Liquidity Profile

Enter Receipts and Disbursements for 36 months (or desired length) to calculate Net Cash Flow per month over the last three years.

If data is difficult to obtain, a portfolio proxy can be used by utilizing the month over month change in book value of the portfolio as the net cash flow.

# Approaches for Determining Portfolio Duration

## Cash Flow Based Approach

### ALM Analysis

#### Step 2 – Projected Cash Flows

Using your own assumptions or average/worst case cash flow projections, we can establish a liability ladder to measure against.

These projections are the net inflow and outflow expectations laddered over the policy limited timeframe of the portfolio.

Projected Net Cash Flows by Year		Worst Outflow	Average Outflow	User Outflow
1	August	(\$3,118,132.31)	(\$2,816,016.20)	
	September	(\$10,234,929.18)	(\$5,986,214.20)	
	October	(\$15,659,983.57)	(\$8,049,693.21)	
	November	\$22,343,380.84	\$24,131,838.28	
	December	(\$12,462,614.70)	(\$11,818,508.50)	
	January	(\$15,426,698.28)	(\$14,084,082.35)	
	February	(\$3,309,020.41)	(\$3,068,198.25)	
	March	(\$17,631,402.62)	(\$14,099,122.36)	
	April	(\$9,626,976.88)	(\$8,639,622.84)	
	May	\$39,991,797.49	\$47,707,704.62	
	June	\$716,383.68	\$3,713,671.46

Macaulay Dur = Sum  
PeriodWt = 5.815

Macaulay Dur = Sum  
PeriodWt = 17.814

Year 2 Modified Monthly Duration =  $17.814 / (1 + (\text{Wtd Avg Tsy yield} / 12)) = 17.795$

Year 2 Annualized Mod Duration =  $17.795 / 12 = 1.483$

# Approaches for Determining Portfolio Duration

## Cash Flow Based Approach

### ALM Analysis

#### Step 3 – DCF/Duration Analysis of Cash Flows

Once the annualized duration's are calculated, we now weight each year based on our preference of coverage of each year's total liabilities.

Duration Optimization Values by Year		
1	<i>Annualized Duration</i>	0.484
2	<i>Annualized Duration</i>	1.483
3	<i>Annualized Duration</i>	2.481
4	<i>Annualized Duration</i>	3.480
5	<i>Annualized Duration</i>	4.477

# Approaches for Determining Portfolio Duration

## Cash Flow Based Approach

### ALM Analysis

### Step 3 – DCF/Duration Analysis of Cash Flows

Portfolio Size	\$300,000,000.00
Immunized Portfolio	\$299,992,155.11
Percent Immunized	100.00%

Immunization Weight	
Year 1	90.00%
Year 2	70.50%
Year 3	70.00%
Year 4	70.00%
Year 5	70.00%

The total immunization weights for each year should create a portfolio that is 100% immunized relative to the portfolio size.

Duration Optimization Values by Year		
1	Sum Present Value of Outflows	\$68,937,604.13
	Sum of Asset Matched Present Values	\$62,043,843.72
	Asset Matched Weight in Portfolio	20.681%

# Approaches for Determining Portfolio Duration

## Cash Flow Based Approach

### ALM Analysis

## Case Study: City and County of San Francisco

### CCSF Investment Pool

- CCSF Investment Pool currently is \$14.7 billion
- Many different participants both discretionary and non-discretionary with 13 major participants
- Monthly apportionment to each participant
- Consists of operating reserves and bond issuance proceeds

### Investment Strategy

- Focus is on **Safety of Principal** and **Liquidity** – **return** is considered after the first two mandates are satisfied
- Emphasis on Asset/Liability Management – matching asset maturities with cash outflows
- Maintaining a consistent average maturity consistent with cashflow profile – not market timing
- Income generation is key – not total return

# CA Government Code 53600.5

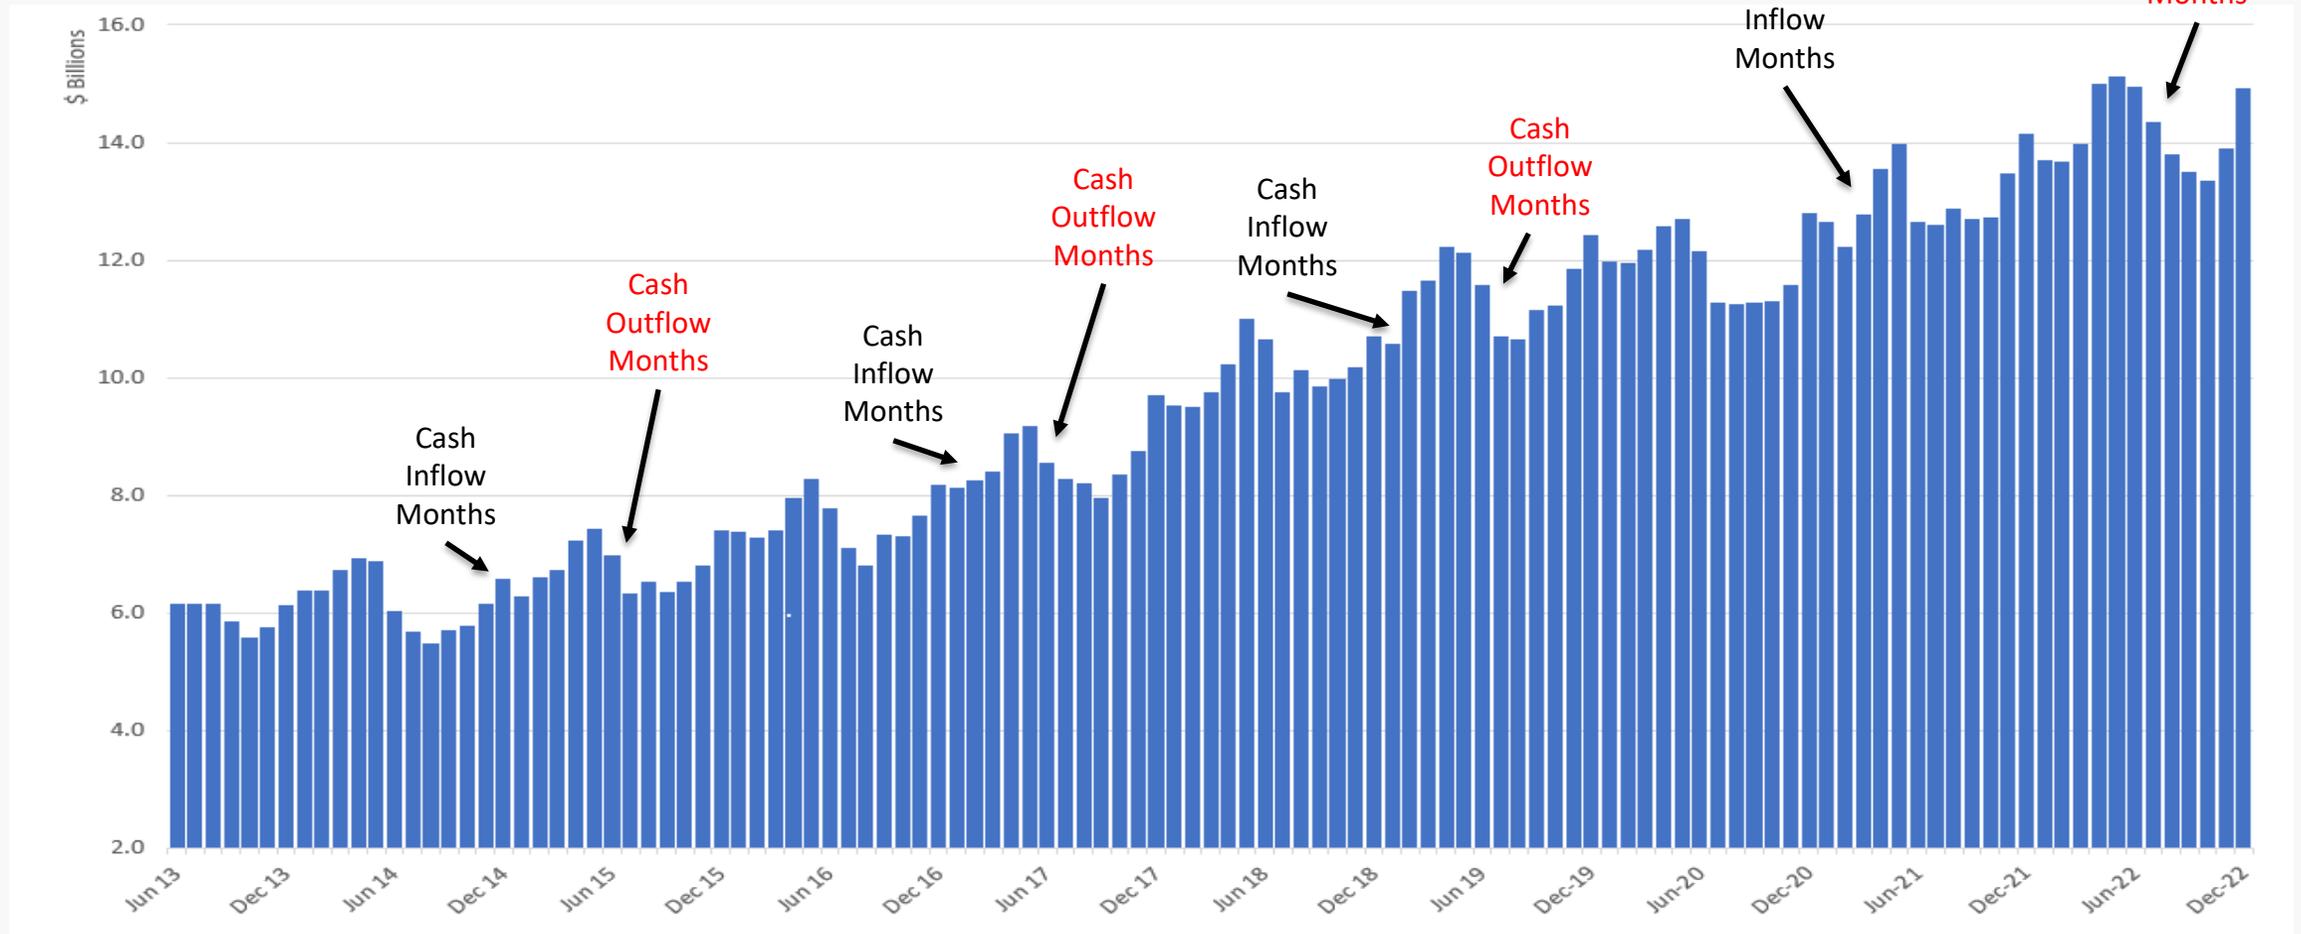

### Objectives

When investing, reinvesting, purchasing, acquiring, exchanging, selling, or managing public funds, the primary objective of a trustee shall be to **safeguard the principal of the funds** under its control. The secondary objective shall be to meet the **liquidity needs** of the depositor. The third objective shall be to **achieve a return** on the funds under its control.

### Cash Flow Based Approach

#### ALM Analysis

- Uses institution's actual cash flow data to measure future liabilities and derive duration needs
- Eliminates bias and idiosyncratic problems that public entities can have with market based approaches (liquidity, sector and structure differences).
- Ensures each institution's duration is unique and not peer or market related.
- Places emphasis on timing and magnitude of investments relative to liabilities versus market based optimizations for the masses.
- Does require more data and effort to establish the projected liability stream and involves calculations that may not be familiar.
- There are opportunity costs associated by limiting the investment universe to any particular timeframe, however it can be argued that maintaining a stable duration and limiting cash balances can more than offset any costs associated with security selection constraints (without this process, cash balances tend to be higher and more conservative securities are purchased due to uncertainty).

This presentation is for informational purposes only. All information is assumed to be correct, but the accuracy has not been confirmed and therefore is not guaranteed to be correct. Information is obtained from third party sources that may or may not be verified. The information presented should not be used in making any investment decisions and is not a recommendation to buy, sell, implement, or change any securities or investment strategy, function, or process.

Any financial and/or investment decision should be made only after considerable research, consideration, and involvement with an experienced professional engaged for the specific purpose. All comments and discussion presented are purely based on opinion and assumptions, not fact. These assumptions may or may not be correct based on foreseen and unforeseen events.

All calculations and results presented are for discussion purposes only and should not be used for making calculations and/or decisions. The data in this presentation is unaudited.

Many factors affect performance including changes in market conditions and interest rates and in response to other economic, political, or financial developments. Investment involves risk including the possible loss of principal. No assurance can be given that the performance objectives of a given strategy will be achieved. Past performance is not an indicator of future performance or results. Any financial and/or investment decision may incur losses.
